

Build a Sales Goal Advisor Agent with Joule Studio, CRM, and SAP SuccessFactors

Prerequisites

- Access to **Joule Studio**
- Access to a **CRM system** with territory data, exposed via an API or OData endpoint
- Access to **SAP SuccessFactors** with the Goal Management module enabled and an API user configured for goal read and write operations

You will learn

- How to identify a sales productivity workflow that is well-suited for agent automation
- How to write an effective **intent statement** for an agent
- How to review and validate the assets created, including the generated **Product Requirements Document (PRD)**
- How to deploy a production-ready Joule Agent to the SAP managed runtime service

Intro

Setting quarterly goals is one of the most valuable things a sales rep can do and one of the most often skipped or done badly. Without easy access to territory data, goals tend to be too vague or disconnected from the rep's actual pipeline.

Understand the Business Challenge

Setting quarterly goals is a critical activity for sales reps - yet it is one of the most often done poorly. Understanding where the friction lives explains why a structured, data-grounded approach makes a difference.

Three categories of quarterly development objective

When a sales rep sits down to set quarterly goals, the meaningful targets typically fall into one of three patterns:

Type	Description	Example
Pipeline objectives	Goals tied to the current state of the opportunity pipeline - targeting conversion rates, deal progression, or revenue contribution from specific accounts or segments.	Opportunities in territory, account revenue potential
Activity objectives	Goals tied to engagement intensity - number of new accounts to activate, leads to qualify, or meetings to schedule within the territory.	Managed accounts count, leads in territory
Growth objectives	Goals tied to improvement relative to historical performance - identifying where the territory underperformed in previous quarters and setting measurable targets for recovery or acceleration.	Historical sales performance, territory trends

Current pain points

The manual approach to goal-setting creates the following operational challenges:

- **No single territory view** - accounts, leads, opportunities, and history live across multiple reports the rep must manually compile.
- **Disconnected systems** - CRM and SuccessFactors aren't linked, forcing context-switching between data review and goal creation.
- **Generic goals** - without easy data access, reps set goals from intuition or copy last quarter's.
- **Inconsistent format** - manually created goals vary in quality and measurability, making quarter-end evaluation difficult.
- **Recurring overhead** - the same data-gathering exercise repeats every quarter, discouraging thorough goal-setting.

The agent eliminates all five pain points: it retrieves territory data automatically, loads the rep's SuccessFactors profile, guides them through a structured goal-selection conversation, and writes confirmed goals directly to SuccessFactors.

In this tutorial, you build a Sales Goal Advisor Agent using Joule Studio. The agent connects live CRM data with the rep's SAP SuccessFactors profile and guides them through a structured conversation to set meaningful quarterly objectives grounded in real numbers. Once confirmed, the agent writes the goals directly into SAP SuccessFactors.

You'll follow the full Joule Studio development process - from a plain-language description of what you want to a deployed Python agent integrated with both a CRM system and SAP SuccessFactors via MCP.

About the scenario: The rep and territory data are illustrative. The same pattern works for any organization using CRM territory data and SuccessFactors Goal Management.

Why this workflow? Goal-setting happens on a predictable schedule, pulls from two known systems, follows a clear conversation flow, and produces a defined output. That's exactly what Joule Studio agents are built for.

Open Joule Studio and Define the Agent Intent

In this step, you select Agent as the solution type and describe what you want the agent to do. Joule Studio takes your intent and translates it into product requirements, a technical specification, and a complete implementation - no manual development required.

1. Open **Joule Studio**.

2. Select **Create** to open the Create Agent dialog.

3. Enter the agent name:

Sales Goal Advisor

4. Enter the following intent statement in the description field:

Please create an agent. The agent should interact with a sales representative in a step-by-step manner to help them create meaningful quarterly development objectives. The agent retrieves territory data from the CRM system - including managed accounts, leads in the territory, open opportunities, and historical sales performance - on a quarterly basis. It fetches the representative's current profile and existing goals from SAP SuccessFactors. Based on this combined data, the agent recommends relevant goal options across pipeline, activity, and growth dimensions, guides the representative through goal selection and refinement in a conversational flow, and upon explicit confirmation, creates the approved goals directly in SAP SuccessFactors.

5. Select **Quick Create** to skip clarifying questions and move directly to solution building. This adds *Fast Track* to the intent statement.

Even with Quick Create, Joule will still ask you to confirm business goals.

←

Create Agent

Solution:

New Solution

Name:

Sales Goal Advisor

Intent Statement:

representative in a step-by-step manner to help them create meaningful quarterly development objectives. The agent retrieves territory data from the CRM system - including managed accounts, leads in the territory, open opportunities, and historical sales performance - on a quarterly basis. It fetches the representative's current profile and existing goals from SAP SuccessFactors. Based on this combined data, the agent recommends relevant goal options across pipeline, activity, and growth dimensions, guides the representative through goal selection and refinement in a conversational flow, and upon explicit confirmation, creates the approved goals directly in SAP SuccessFactors.

☒ Quick Create: Skip clarifying questions and start directly building the solution

Create

Cancel

6. Select **Create** to proceed.

Writing an effective intent statement

A strong intent statement covers four dimensions: what the agent does, what data it works with, what decisions it supports, and what guardrails it must respect. This one covers all four — giving Joule Studio enough context to derive an accurate architecture without any technical input. If the generated interpretation doesn't match your expectations, refine the statement here before continuing.

7. Confirm the business goals.

Sales Goal Advisor

growth dimensions, guides the representative through goal selection and refinement in a conversational flow, and upon explicit confirmation, creates the approved goals directly in SAP SuccessFactors. Fast Track

Activate Skill 142ms

Read File 64ms

Update solution metadata 181ms

Now let me investigate the business challenge in the knowledge graph while discovering relevant APIs.

Called 4 tools 45s

Now I need to gather Business Goals from you — this is required even in fast-track mode for AI agent solutions.

✓ To complete the intent document for your Sales Goal Advisor agent, I need one or two measurable success metrics. For example:
"Reduce time to set quarterly goals from 2 hours to 20 minutes"
"Increase goal adoption rate (% of reps who complete goal-setting) from 60% to 90%"
"Improve goal quality score (manager-rated relevance) from 3/5 to 4.5/5"
What outcomes should this agent deliver, and do you have any baseline numbers or targets in mind?

- ☒ Reduce goal-setting time (e.g. from 2h to 20 min)
- ☐ Increase rep adoption of structured goal-setting (e.g. 60% → 90%)
- ☒ Improve goal quality / relevance score
- ☐ I'll skip — use agent-derived estimates

Submit Answer

Message Joule...

Even when **Quick Create** is selected, Joule will ask you to confirm your business goals before proceeding. Answer any additional clarifying questions to the best of your knowledge - these inputs help Joule tailor the generated PRD.

Review the Intent

1. After you submit the intent statement, Joule Studio generates an **intent.md** and presents a summary in the chat. Review this summary before proceeding to the *Requirements* phase.

Sales Goal Advisor

☐ I'll skip — use agent-derived estimates

Thought 22s

Now I have everything needed. Let me write the intent.md and proceed.

Write File 333ms

Sales Goal Advisor

Intent:
AI agent that guides sales representatives through quarterly development objective-setting using CRM territory data and SAP SuccessFactors.

Problem Statement:
Sales representatives spend excessive time manually gathering territory insights and translating them into meaningful quarterly goals in SuccessFactors. The process is largely unguided, leading to generic or misaligned objectives. The agent should retrieve CRM territory data (accounts, leads, open opportunities, historical performance) and the rep's current SuccessFactors profile and goals, then recommend relevant pipeline/activity/growth objectives and guide the rep through goal selection and creation in a conversational flow.

Goals and Metrics:

- Territory Data Retrieved** — Agent fetches CRM accounts, leads, open opportunities, and historical sales performance for the rep's territory.
- SuccessFactors Profile Loaded** — Agent retrieves the rep's employee profile and existing/prior goals from SuccessFactors.
- Goal Options Recommended** — Agent presents ranked goal options across pipeline, activity, and growth dimensions based on combined data.
- Goal Selection Confirmed** — Rep selects, refines, and explicitly confirms their chosen goals in a conversational flow.
- Goals Written to SuccessFactors** — Approved goals are created in SuccessFactors Goal Plan via API.

Business Context:
The challenge maps to the Lead to Cash E2E under "Plan to Optimize Marketing and Sales", specifically the "Plan sales and manage performance" sub-process — covering territory planning, goal establishment, and performance tracking.

Message Joule...

Joule uses AI. Verify results.

Choose **Read more** to see the complete summary. This shows how Joule Studio interpreted your input.

2. Verify that this matches your intent. If the summary is missing an element or describes a different scope, you can refine the intent statement and re-submit.
3. You have the choice whether to create a solution directly or first the requirements document. In this tutorial, you will create the requirements first.

Later, you will be able to find the **intent.md** file under **Solution Artifacts**. There you can scroll down to the **Fit Gap Analysis** and see what Joule has identified. Then you can scroll down to the **Recommended Solution**. It describes a Python-based AI agent that uses the Agent-to-Agent (A2A) and what it should be able to do. At the bottom of the solution card, review the **Intent fit score**. A score of 90% or higher confirms a very high degree of alignment between the proposed solution and your original intent statement. If the score is lower, consider refining your intent statement.

Product Requirements Document

In the **Requirements** phase, Joule Studio generates a **Product Requirements Document (PRD)**. This is an important document that you are expected to review each section carefully - this document defines the agent's operational boundaries and becomes the source of truth for all subsequent phases.

1. Choose **Create Requirements File**.

Wait until the requirements have been generated.

2. Choose **Requirements** under **Solution Artifacts**. This opens the low-code view of the PRD. To access the raw Markdown file, toggle Files in the Solution Artifacts panel - this is the code view of the same document.

Product Requirements Document (PRD)

Title: Sales Goal Advisor Agent Date: 2026-09-15 Owner: Sales Enablement / People & Performance Solution Category: AI Agent

Product Purpose & Value Proposition

Elevator Pitch: Sales representatives today spend up to two hours per quarter manually gathering territory data and translating it into SuccessFactors goals — often producing generic objectives disconnected from actual pipeline reality. The Sales Goal Advisor Agent eliminates this friction by pulling CRM and HR data automatically, reasoning over it, and guiding each rep through a personalised goal-setting conversation that ends with confirmed goals written directly into SuccessFactors.

Business Need: The quarterly goal-setting process is unguided and time-consuming. Reps lack an easy way to connect their CRM territory view (accounts, leads, open opportunities, historical performance) with SuccessFactors goal plans. The result is low-quality, generic objectives that fail to reflect actual territory conditions — reducing coaching value and alignment with sales strategy.

Expected Value:

- Reduce per-rep goal-setting time from ~2 hours to ≤20 minutes per quarter.
- Improve manager-rated goal relevance score from 3/5 to ≥4.5/5 within one full quarter of use.

Product Objectives (Prioritised):

1. Deliver territory-aware, personalised goal recommendations grounded in real CRM and HR data.
2. Reduce the time and cognitive load required to complete quarterly goal-setting.
3. Ensure all approved goals are accurately created in SuccessFactors without manual data entry.

Business Metrics

Metric	Baseline	Target	Timeline	Process / Capability	Source
Time to complete quarterly goal-setting	~2 hours	≤20 minutes	Per quarter	Plan sales and manage performance	user
Goal quality / relevance score (manager-rated)	3 / 5	≥4.5 / 5	End of first full quarter using agent	Establish sales goals and measures	user

Sales Goal Advisor

API (MCP, SuccessFactors, etc.) + SuccessFactors Continuous Performance MCP Server + SAP Sales Cloud OData APIs (MCP translation file)

Milestones: 5 — Territory Data Retrieved → SF Profile Loaded → Goal Options Recommended → Goal Selection Confirmed → Goals Written to SuccessFactors

Extensibility & Instrumentation: Yes — milestone-based OpenTelemetry spans, extension hooks for future goal dimensions

Proceeding to write the PRD now.

Write File 348ms

product-requirements-document.md has been saved.
product-requirements-document.md has been saved.

Here's what the PRD covers:

- 5 must-have requirements** — CRM data retrieval, SuccessFactors profile fetch, personalised goal recommendations, conversational selection/refinement, and goal write-back — plus a cross-cutting confirmation guardrail.
- 2 personas** — Alex (sales rep, primary) and Jordan (sales manager, secondary).
- Full agent behaviour spec** — all 7 tools documented with read/write risk levels, and a hard guardrail that blocks `create_goal` without explicit rep confirmation.
- 5 instrumented milestones** — each with achievement and miss log statements for production observability.
- Extensibility design** — new goal dimensions and MCP tools can be added without touching core reasoning logic.

The next step is to generate the technical specification, which will turn these requirements into a concrete implementation checklist. Would you like to proceed?

Message Joule...

Include scope AI. Verify results.

The Business Context section maps your intent to the actual business process - it identifies personas (e.g., sales rep, manager), pain points, success metrics, and guardrails. Review this section carefully: it defines the operational boundaries the agent will respect throughout all subsequent phases.

Product Purpose and Value Proposition

At the top of the document, you will find the elevator pitch, the business need and expected value described. The product objectives are also listed.

Must-Have Requirements

3. Scroll down to the **Requirements**.

The screenshot displays the 'Sales Goal Advisor' application in a 'Draft' state. The interface is divided into several sections:

- Top Bar:** Includes 'Develop' and 'Manage' tabs, a 'Deploy' button, and an 'Actions' dropdown menu.
- Solution Preview:** A large empty area on the left for previewing the solution.
- Solution Artifacts:** A sidebar on the left with a 'Files' icon and a list of artifacts: 'Intent', 'Requirements' (highlighted), and 'Specification'.
- Requirements Section:** The main content area on the right, titled 'Requirements'. It features a 'Generate Solution' button and a list of requirements:
 - Real-time CRM event triggers (the agent runs on-demand per rep, not event-driven).
 - Generating compensation or incentive plans.
- Must-Have Requirements:** A section highlighted with a red box, containing three ranked requirements:
 - R1: CRM Territory Data Retrieval**
 - **Problem to Solve:** Reps cannot easily see a consolidated view of their territory when setting goals.
 - **User Story:** As a sales rep, I need the agent to automatically pull my CRM territory data — managed accounts, active leads, open opportunities, and historical quarterly performance — so I do not have to gather this manually.
 - **Acceptance Criteria:**
 - Given a rep's identity, when the agent starts a goal-setting session, then it retrieves and summarises accounts, leads, opportunities, and last-quarter performance for that rep's territory.
 - Data is fetched from SAP Sales Cloud via OData/REST APIs.
 - **Maps to Objective:** 1, 2
 - **Priority Rank:** 1
 - R2: SuccessFactors Profile & Goal Fetch**
 - **Problem to Solve:** Reps and the agent need context on existing goals to avoid duplication and ensure progression.
 - **User Story:** As a sales rep, I need the agent to retrieve my current SuccessFactors profile and active/prior goal plans so recommendations build on what I have already committed to.
 - **Acceptance Criteria:**
 - Given a rep's user ID, when the session starts, then the agent fetches the rep's employee profile and current goal plan from SuccessFactors PMGM API.
 - Prior quarter's goals are surfaced as context for new recommendations.
 - **Maps to Objective:** 1
 - **Priority Rank:** 2
 - R3: Personalised Goal Recommendation**
 - **Problem to Solve:** Reps do not know which goal dimensions (pipeline, activity, growth) are most relevant to their specific territory situation.
 - **User Story:** As a sales rep, I need the agent to recommend specific, data-grounded goal options ranked by relevance to my territory so I can make an informed selection.
 - **Acceptance Criteria:**
 - Given retrieved CRM and SuccessFactors data, when the agent analyses the context, then it presents at least three goal options per dimension (pipeline, activity, growth) with a short rationale for each.
 - Recommendations reference actual territory metrics (e.g., "Your open opportunity value is 40% below target — consider a pipeline-

At the bottom of the Requirements section, there is a 'Requirements.md' file name, a 'Cancel' button, and a 'Save' button.

This section provides ranked requirements, with their user stories and acceptance criteria.

Automation Level and Agent Behavior

Sales Goal Advisor Draft

Develop Manage Deploy Actions

Solution Preview

Requirements Generate Solution

~ **Solution Architecture**

Architecture Overview: A Python-based A2A protocol agent deployed on SAP BTP. The agent orchestrates calls to SAP Sales Cloud (CRM) and SAP SuccessFactors (HR/Goals) to retrieve context, applies LLM reasoning to generate recommendations, manages multi-turn conversation state, and writes confirmed goals back to SuccessFactors.

Key Components:

- Sales Goal Advisor Agent** (Python, A2A): Core reasoning and conversational loop.
- SuccessFactors PMGM MCP Tool:** Generated from the SuccessFactors Goal Plan OData API (`sap.sf:apiResource:PerformanceandGoalsPMGM:v1`) — used to read and write goals.
- SuccessFactors Continuous Performance MCP Server** (`sap.sf:apiResource:PMGMContinuousPerformanceManagement_MCP_e13kf:v1`): Used to retrieve prior check-ins and performance context.
- SAP Sales Cloud CRM MCP Tool:** Generated from Sales Cloud OData APIs (Accounts, Leads, Opportunities) — used to retrieve territory data.
- SAP Generative AI Hub:** LLM endpoint for reasoning and natural language generation.

Integration Points:

- SAP Sales Cloud OData APIs — read-only, per session, on-demand.
- SAP SuccessFactors PMGM OData API — read (profile, goals) and write (new goals), on confirmation only.
- SAP SuccessFactors Continuous Performance MCP Server — read-only.

Agent Extensibility & Instrumentation

Agent Extensibility:

- The agent is designed with extension points to support future goal dimensions (e.g., learning & development goals, DEI objectives).
- New MCP tools (e.g., additional CRM data sources, SAP Analytics Cloud) can be added to the agent's tool registry without modifying core reasoning logic.
- Skill resources can be updated independently of the agent runtime to adjust goal recommendation prompts and dimension definitions.

Business Step Instrumentation: All five key business milestones must emit structured log statements to support observability and monitoring in production. Log statements follow the pattern: `[MILESTONE_ID]. [achieved|missed]: [description]`.

Automation & Agent Behaviour

Requirements.md Cancel Save

This section is critical - it defines exactly what the agent does autonomously, what requires a human decision, and what guardrails are in place.

The agent operates at a **hybrid automation level**:

- *Autonomous actions (no human required)*, such as detect cost anomalies against configured thresholds
- *Human approval required*, such as writing revised budgets back to SAP S/4HANA.

Inspect the Generated Specification

In the **Specification** phase, Joule Studio translates the PRD into a generated file tree - a complete, structured, and reviewable set of assets and configuration files. No code has been written yet; this is the blueprint.

1. Select **Generate Specification**

2. Wait for the specification generation to complete. Review the summary of what has been created so far. Once you have reviewed the specification, type `execute specification/specification.md` in the message window to trigger solution generation. You will do this in the next step.

The specification is complete. Here's a summary of what was generated:

****1** The specification is complete. Here's a summary of what was generated:

1 asset — sales-goal-advisor-agent (Python A2A AI Agent)

Specification files written:

specification/specification.md — master orchestration checklist
 specification/sales-goal-advisor-agent/specification.md — full
 implementation TODO list
 specification/guidelines*.md — 5 guideline files copied from skills

API specs saved (api-specs/):

pmgm-goal-plan.edmx — SuccessFactors Goal Plan OData (needs MCP translation
 file)
 ec-employee-profile.edmx — SuccessFactors Employee Profile OData (needs
 MCP translation file)

MCP tool schemas saved (mcp-specs/):

2 tools from the Continuous Performance MCP server (already deployed, ORD ID:
 sap.sf:apiResource:PMGMContinuousPerformanceManagement_MCP_el3kf:v
 1)
 1 tool from the Forms Management MCP server (already deployed, ORD ID:
 sap.sf:apiResource:PMFormsManagement_MCP_1qql2:v1)

Key implementation tasks specified:

7 agent tools (CRM reads, SF profile/goals read, SF goal create)
 Conversational 5-step flow with hard confirmation guardrail before any write
 5 business milestones with structured log statements and OpenTelemetry spans
 Goal recommendation runtime skill with territory-aware rationale templates
 8 unit tests + 1 integration test; coverage ≥ 70% required

To start building, say **"execute specification/specification.md"**.

The entire specification is transparent and reviewable **before any deployment is triggered**.

Generate the Solution

In the **Solution** phase, Joule Studio executes the specification and generates the complete, runnable solution - the anomaly detection engine, scenario calculation logic, chart generation, and approval-gated write-back - with no manual development required. Automatic tests will be created and executed.

1. Select **Requirements** and choose Generate Solution or enter this command in the message window.

Message Joule...

Joule uses AI. Verify results.

- Wait for the solution generation to complete before proceeding. You can find the agent under **Solution Artifacts**.

During this phase, Joule Studio:

- Scaffolds the Python agent and generates four MCP server packages from the assets/ file tree — covering CRM territory data, SuccessFactors goal management, employee profile retrieval, and continuous performance history
- Wires up the CRM and SuccessFactors Goal Management API bindings
- Configures the SAP Generative AI Hub connection for conversational guidance and goal narration
- Builds the territory metrics aggregation engine that structures CRM data as grounded inputs to the LLM
- Applies the four operational guardrails, including the confirmation gate before any SuccessFactors write
- Instruments all agent actions with audit logging - data retrieval, goal recommendations, conversation turns, and write-backs

- You can find the agent under Solution Artifacts.

The screenshot displays the SAP Business Studio interface for the 'Sales Goal Advisor' agent. The top navigation bar includes 'Sales Goal Advisor' (Draft), 'Develop', 'Manage', 'Deploy', and 'Actions'. The left sidebar shows 'Solution Artifacts' with a list of artifacts: 'Intent', 'Requirements', 'Specification', 'sales-goal-advisor-agent' (highlighted with a red box), 'sap-sf-ec-employee-profile-mcp-s...', and 'sap-sf-pm-gm-goal-plan-mcp-server'. The main area shows the 'Overview' tab for the 'sales-goal-advisor-agent'. It includes sections for 'System Prompt' (undefined), 'LLM Configuration' (sap/anthropic--claude-4.5-sonnet), 'Agent Configurations' (Circuit Breaker Failure Threshold: 3, Circuit Breaker Cooldown (seconds): 30, Thread TTL (seconds): 3600, Summarization Trigger (tokens): 30, Custom Injection Resistance Instructions: undefined), and 'Tools and Skills' (MCP Servers: 4 servers, + Add Server).

Reviewing the Agent Definition

Select the agent under Solution Artifacts to open its definition. In the low-code view you can see:

- The LLM configuration (e.g., sap/anthropic--claude-4.5-sonnet)
- MCP Servers - sap-sf-pm-gm-goal-plan-mcp-server allows the agent to read and write SuccessFactors Goal Plans. sap-sf-ec-employee-profile-mcp-server allows the agent to retrieve the rep's employee profile.
- Agent Configurations: circuit-breaker threshold, thread TTL, summarization trigger.

To see the generated Python code, toggle to the pro-code (Files) view.

Reviewing the MCP Servers

Select MCP Servers in the agent definition to see the four servers that were configured automatically. Each one gives the agent access to a specific system:

- sap-sf-pmgoal-plan-mcp-server — connects to the SAP SuccessFactors Goal Plan OData API. This allows the agent to read the rep's existing goals and write newly confirmed goals back to SuccessFactors.
- sap-sf-ec-employee-profile-mcp-server — connects to the SAP SuccessFactors Employee Profile OData API. This allows the agent to retrieve the rep's profile at the start of each session.
- SAP Sales Cloud OData MCP tool — connects to SAP Sales Cloud via OData REST APIs. This allows the agent to retrieve territory data — managed accounts, active leads, and open opportunities — on demand.
- SuccessFactors Continuous Performance MCP server — connects to the Continuous Performance Management API. This allows the agent to retrieve prior check-ins and historical performance context to inform goal recommendations.

No configuration is required: Joule Studio generated and wired up all four servers from the specification.

4. In the Evaluation tab you can generate evaluation scenarios for this agent based on your intent.

Once Joule confirms the solution build is complete, proceed to Testing Overview to see the automated test results."

Validate the Agent with Automated Tests

The **Testing** phase is triggered automatically by Joule once the solution build is complete. It runs an automated validation suite derived from the specification - you do not need to initiate it manually. Wait for Joule to confirm that testing has finished before proceeding.

1. Once testing is complete, open **Testing Overview**. Review the results and compare the test categories to your specification to verify all requirements have been validated.
2. Verify that all tests pass before proceeding to deployment.

31/31 tests passed. Here's the full breakdown:

Test Results: Sales Goal Advisor Agent

Category	Tests	Result
Agent unit tests (tools, instrumentation, flow)	26	✓ All passed
Structure tests (file/directory validation)	3	✓ All passed
Server tests (A2A startup + agent card endpoint)	2	✓ All passed
Total	31	✓ 31/31 passed

Highlights from the server test:

Agent started successfully on a dynamic port

GET /.well-known/agent-card.json returned **HTTP 200** with valid JSON

Agent card correctly reports:

name: sales-goal-advisor-agent

description: full personalised goal-setting description

skills: sales-goal-advisor-agent

Coverage note:

instrumentation.py (the new business milestone code): **83%**

agent.py , circuit_breaker.py , mcp_providers/agw.py : **0%** — these require live SAP AI Core and MCP server connections, and are intentionally not exercised by offline unit tests

The agent is fully tested and ready to deploy. Would you like to proceed with deployment?

If any test fails, Joule will usually try to fix it automatically. If it gets stuck, you might converse with Joule to help fix the problem.

3. Select the agent under **Solution Preview**.

The screenshot displays the 'Sales Goal Advisor' application interface. At the top, there's a header with the application name, a 'Draft' status, and buttons for 'Develop', 'Manage', 'Deploy', and 'Actions'. The main area is divided into two sections. On the left, a sidebar contains a 'Solution Preview' section with a link to 'sales-goal-advisor-agent' and a 'Solution Artifacts' section listing files like 'Intent', 'Requirements', 'Specification', and 'sales-goal-advisor-agent'. On the right, the 'Try Your Agent' section features a large heading, a subheading 'Interact with your agent before it goes live.', and a chat input field with the placeholder text 'Can I help with anything else?'. Below the chat field, a status message reads 'Joule uses AI. Verify results.' and a 'Traces' section with 'Traces' and 'Logs' buttons is visible.

In the chat field, enter a prompt that does not require live tool calls. For example: What are you responsible for? The agent will respond with a description of its capabilities without needing to connect to CRM or SuccessFactors.

You can do some further testing before deployment.

Deploy the Agent to Development Landscape

With all tests passed and the validation score confirmed, the **Agent** is ready for deployment.

1. Choose **Deploy**. Then confirm with **Deploy** again.

Joule Studio packages the agent and deploys it to the **SAP managed runtime service** on BAIP. Once deployment completes, the `deploy_result.json` file in the `specification/` folder is populated with the live deployment details (endpoint URL, runtime ID, deployment timestamp).

Your agent is now operational.

Screenshot of successful deployment result (the `deploy_result.json` populated state, or the Manage tab showing the live deployment) with a caption to include

If you are working in a team or want to version-control the generated code, Joule Studio supports GitHub sync. You can find this option under Actions in the top bar.

For governance reasons, deployment to production is not done from within Joule Studio.

How the agent works in production

Once deployed, agents are automatically discoverable through Joule. When users ask questions that match the agent's area of responsibility, Joule routes the request to the agent. Users don't need to know that a

custom agent exists or how to find it.

Monitoring the Agent

Once deployed, switch to the Manage tab in Joule Studio to access governance and monitoring. Here you can view runtime status, active deployments, usage metrics, and audit logs.

Screenshot of the Manage tab to include

Summary

You have completed the end-to-end design and deployment of a Sales Goal Advisor Agent using Joule Studio. In doing so, you have:

- Identified the three dimensions of quarterly sales development objectives (pipeline, activity, growth) and the manual pain points that prevent data-grounded goal-setting today
- Written an effective intent statement that Joule Studio translated into a structured, production-ready solution
- Reviewed and validated an Idea Board with five measurable goals and a recommended dual-MCP-server architecture
- Evaluated a generated PRD defining product objectives, automation level, LLM boundaries, and operational guardrails
- Reviewed automated test coverage across data retrieval, goal recommendations, conversational flow, and SuccessFactors write-back
- Deployed the agent to the SAP managed runtime service

The agent turns what was previously a fragmented, manual, quarterly exercise into a structured, data-grounded, conversational workflow - from territory data retrieval to confirmed goals written directly into SuccessFactors - with no manual development required.
